

Figure 1-2. (A) Fundus photograph of the left eye shows acute left superotemporal macular BRVO with a wedge of intraretinal hemorrhages and cotton wool spots, with the apex pointed at the site of occlusion. (B) Fluorescein angiogram (early frame 24s) shows blockage from hemorrhages from BRVO. (C) Fluorescein angiogram (late frame 8 min 55s) shows hyperfluorescence from diffuse leakage and no capillary nonperfusion. (D) Optical coherence tomography image shows cystoid macular edema superior to the fovea with minimal subfoveal subretinal fluid.
